Infrastructure as Code and Service Discovery
with Terraform and Consul

- Terraform
 - What is Terraform
 - Terraform commands
 - Default AWS EC2 app setup
 - Terraform demo
- Consul
 - Consul overview
 - Consul cluster
 - Service discovery
 - Docker & Consul
 - Consul demo

TERRAFORM

WHAT IS TERRAFORM?

- Build, change and version your infrastructure
- This includes, instances, network, DNS, ...
- Infrastructure as code
- Execution plans
- Resource graphs
- Change automation

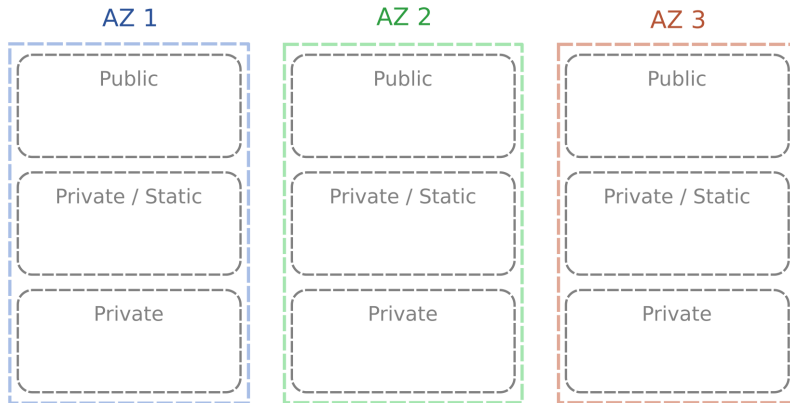

- Plan
- Apply
- Destroy
- Show

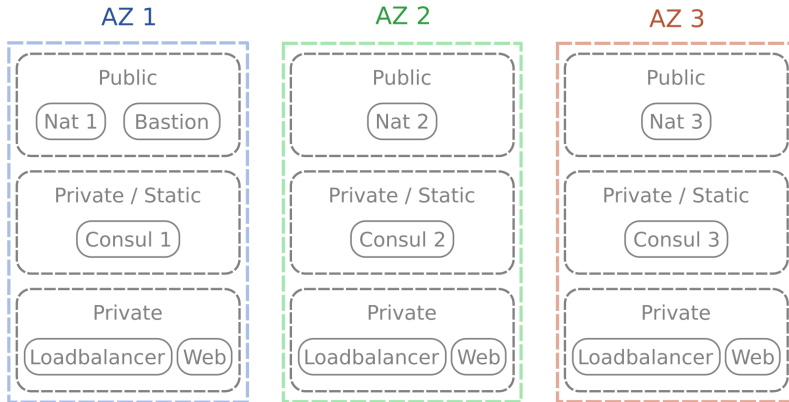

- Public and private subnets
- Security groups
- Bastion host
- Nat instance

DEFAULT AWS EC2 APP SETUP

TERRAFORM DEMO

CONSUL

- www.consul.io
- by HashiCorp
- Service Discovery & Configuration
- Distributed, Highly available, Datacenter aware

- Service Discovery
- Health Checking
- Key/Value Storage
- Multi Datacenter

- Central catalog of component services (e.g. webapp, mysql, redis)
- Dynamic registration and discovery
- Supports DNS and HTTP interfaces
- Enables elastic infrastructures

- Health checks for individual services (and nodes)
- Unhealthy service instances don't receive requests
- Automatic alerting and self-healing

- Dynamic configuration
- Coordinated actions & Event triggers
- Feature flagging

- Support for multiple datacenters
- Service queries can be restricted to any DC

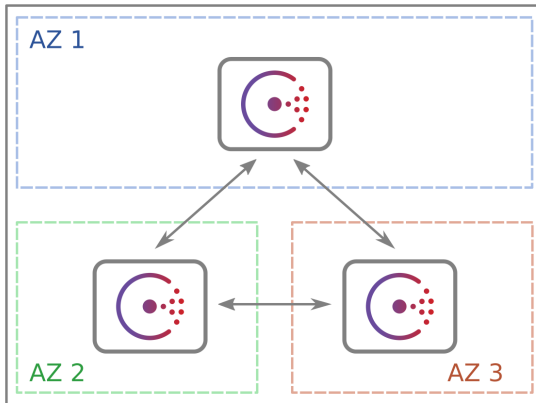

- **gliderlabs/registrator** (github.com/gliderlabs/registrator)
- Automatic service registration for Docker containers
- Perfect for Dockerized applications

- **consul-template** (github.com/hashicorp/consul-template)
- Template rendering based on Consul entries
- Automatically update config files
- ... haproxy.cfg in our case

www.consul.io/downloads_tools.html

- Cluster consists of Server- and Client nodes
- Majority of Server nodes needed for quorum
- Three servers across different AZs
- Single failure tolerated
- Clients connect to Server nodes

CONSUL CLUSTER SETUP

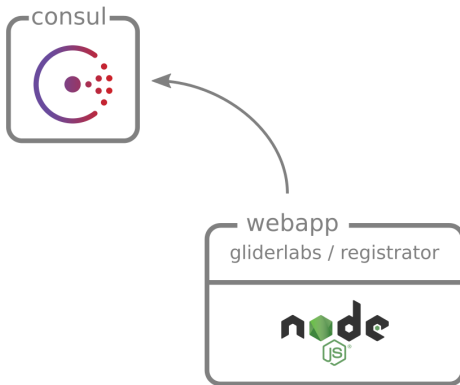

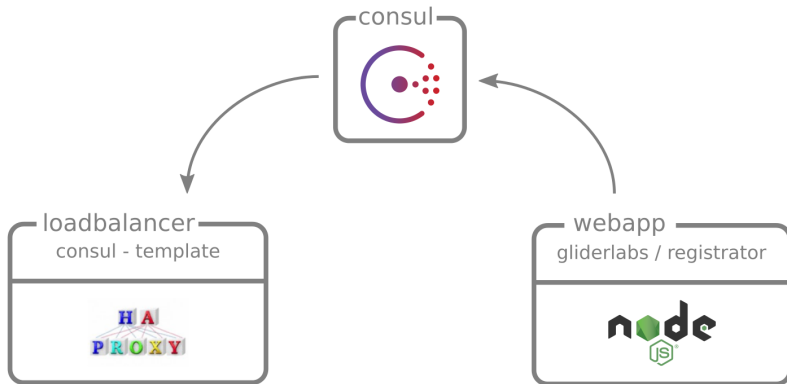

CONSUL CLUSTER SETUP

- One service: **webapp**
- Serves a Node.js app that lists all webapp service instances
- Uses the Node.js consul module
- haproxy loadbalancer routes requests to available webapp instances

BROWSER DEMO & CONSUL UI
